#### 1. Scope of Document

This document defines the security policy for the Command Encryption Module, also referenced as the cryptographic module. This security policy follows the requirements of Federal Information Processing Standards publication (FIPS PUB) 140-2, Security Requirements for Cryptographic Modules.

#### 2. Cryptographic Module Specification

The cryptographic module (Module) is a firmware module as defined by FIPS PUB 140-2 submitted for FIPS 140-2 Level 2 validation. The purpose of the Module is to encrypt the commands transmitted to other systems. The Module does not perform any other cryptographic function.

The Module is a Multi-Chip Standalone module as defined by FIPS PUB 140-2. The cryptographic boundary of the Module is the case of the hardware computing platform.

Security Requirements Section	Level
Cryptographic Module Specification	2
Cryptographic Module Ports and Interfaces	2
Roles and Services and Authentication	2
Finite State Machine Model	2
Physical Security	2
Operational Environment	N/A
Cryptographic Key Management	2
EMI/EMC	3
Self-Tests	2
Design Assurance	2
Mitigation of Other Attacks	N/A
Cryptographic Module Security Policy	2
Overall Level of validation	2

#### **Table 1 Module Compliance Table**

Command Encryption Module Security Policy Version 2.0

### **3. Module Ports and Interfaces**

The table below describes a mapping of logical interfaces to physical ports:

FIPS 140-2 Interface	Logical Interface	Physical Interface
Data Input Interface	Input parameters of module function calls	Ethernet/Network Port
Data Output Interface	Output parameters and return values of	Ethernet/Network Port
	module function calls	
Control Input Interface	Module control function calls	Ethernet/Network Port
Status Output Interface	Return values from module status function	Monitor
	calls	Ethernet/Network Port
Power Interface	Initialization function	Power Interface

### 4. Roles, Services, and Authentication

### **4.1 Access Control Policy**

The Module supports two roles: User and Crypto-Officer. Table 3 below describes the authenticaion mechanism:

Table 3: Roles and Re	quired Identification and Authentication
I doite of Itores and Ite	qui cu rucincuncu una riumencication

Approved Operators	Type of Authentication	Authentication Data	Strength of Authentication
User	Role Based	24 bit Password	1:16,777,216 in guessing the password
Crypto-Officer	Role Based	8 alpha/numeric/special	The length of password has to be 8
		characters	characters. The characters contain
			alphabet, number, and special
			characters. Therefore the password
			has more than 6,095,689,385,410,816
			(= 94^8) patterns.

### 4.2 Services

The Module supports the services listed in table 4. The table groups the authorized services by the operator roles and identifies the Cryptographic Keys and CSPs associated with the services. The access type is also identified per service.

**R** - The item is **read** or referenced by the service.

W - The item is written or updated by the service.

**E** - The item is **executed** by the service. (The item is used as part of a cryptographic function.)

Role	Authorized Services	Cryptographic Keys and CSPs	Access Type
Crypto-Officer	Setup and Initialization	Password	W, E
51	Run Self Tests	None	E
	Change Own Password	Password	W, E
	View Audit Data	None	R
	Key Zeroization	Triple-DES key	W
	Module Zeroization	Triple-DES key, Password	W
	Show Status	None	R
User	Symmetric Encryption	Triple-DES key, Password	Е
	Key Change	Triple-DES key, Password	W, E
	Show Status	None	R

#### Table 4: Services for Authorized for Roles

#### 4.3 Crypto Officer role

- Setup and Initialization: The Crypto-Officer is responsible for the secure setup and initialization of the module. This includes inputting the cryptographic keys from ROM reader, turnning on the key change service, turnning on the encryption service, change password, and set physical secuirty parameters.
- Run Self-Tests: The module is located in a locked rackmount cabinet with access only by the Crypto-Officer. The Crypto-Officer must unlock the cabinet to power-on the device to run all self-tests automatically.

Change Own Password: The Crypto-Officer can change their own password.

- View Audit Data: The Crypto-Officer can view the encryption start and stop logs and view the key change logs.
- Key Zeroization: The Crypto-Officer can perform the zeroization of all keys by issuing the zeroize service.
- Module Zeroization: The Crypto-Officer can perform the zeroization of all keys and CSPs by overwriting the hard drive.

Show Status: The Crypto-Officer can view the status of the symmetric encryption service.

#### 4.4 User Role

Symmetric Encryption: The User can perform symmetric encryption of command data signals input into the Module.

Key Change: The User role can issue the key change command to force a key change for the Module.

Show Status: The User can view status of the key change service.

#### 5. Physical Security

The Module was tested on a HP Compaq 6000 Pro hardware computing platform with the following configuration:

- Intel<sup>®</sup> Celeron<sup>®</sup> E3300 2.5 GHz Processor
- 2GB DDR3-1333MHz SDRAM DIMM

- 160GB Disk Drive
- 16x DVD-ROM Drive
- Intel<sup>®</sup> Q43 Express Chipset
- Intel<sup>®</sup> Graphics Media Accelerator 4500
- Intel<sup>®</sup> 82567LM Gigabit Ethernet Controller
- RS-232C D-Sub 9 PIN
- RGB Mini D-Sub 15 PIN (Monitor Port)
- DVI (Display Port)
- 10 USB 2.0 ports (4 in Front, 6 in Rear)
- 2 PS/2 Compatible 6 PIN Mini DIN
- 4 Stereo Mini Port (2 in Front, 2 in Rear)

The Module's removable cover and all external physical ports except the ports used in FIPS 140-2 mode (RGB Mini D-Sub 15 PIN Monitor port and Ethernet RJ45 port) are protected with 5 tamper evident seals as part of the setup and initialization procedure. The tamper evident seals shall be installed for the module to operate in a FIPS Approved mode of operation.

Figures 1, 2 and 3 indicate the exact locations of the tamper evident seals. Note that one seal (#4) is split 2/3 and attached at left and right of the RGB Mini D-Sub 15 PIN Monitor port, to allow the use of this port in FIPS 140-2 mode.

Figure 1 Front

### Command Encryption Module Security Policy Version 2.0

Figure 2 Back

Figure 3 Right Side

There is no tamper evident seal on the left side.

The filler panels that cover the unpopulated slots on the back of the chassis shown in Figure 2 cannot be removed without opening the top cover, which is protected with a tamper evident seal as shown in Figure 3. The black plastic filler panel that covers the unpopulated bay of the 3.5 inch Floppy Drive on the front of the chassis is protected with a tamper evident seal (seal #2), which protects also the DVD-drive as shown in Figure 1.

To replace a tamper evident seal, all traces of the previously removed seal must be first eliminated. The surface must be cleaned with a solution consisting of alcohol and distilled water in the areas where the tamper evident seals are to be applied. The seals must be applied on clean and dry surfaces only.

It is the responsibility of the Crypto Officer to perform the inspection and testing of the physical security mechanisms as described in Table 5.

Also, it is the responsibility of the Crypto Officer to secure and have control of any unused seals.

Refer to the Crypto Officer Guidance document for information on how to order new tamper evident labels.

Physical Security Mechanisms	Recommended Frequency of Inspection/Test	Inspection/Test Guidance Details
Tamper evident Seals	• Once a day: During operations	Compare the record with the
	• Once a month: Others	condition of tamper evident seal
Rack with Combination dial lock	• Once a day: During operations	Compare the record with the
	• Once a month: Others	condition of combination lock
		number

 Table 5: Inspection/Testing of Physical Security Mechanisms

### 6. Key Management and CSP's

The Module employs the Triple-DES encryption. Characteristics of Triple-DES implemented in the Module are as follows:

- CFB (Cipher Feed Back) Mode
- 3 independent keys

The algorithm certificate number is 1119.

Table	6:	Kevs	and	CSP	Table
Idole	••	ALC'J D			IGNIC

Key and CSP	CSP Type	Storage	Use	Role
Symmetric Keys	Triple-DES	Plaintext	Data encryption	User
Password	Password	Plaintext	Authentication	User, CO

### 6.1 Key Input

As the module does not support key generation, keys are input into the Module via USB on PC as part of the setup and initialization procedure. Keys are never input or output while the Module is operational.

### 6.2 Key Storage

Keys are stored in the hard drive when keys are input from ROM reader. A key is temporarily stored in RAM during a encryption state. When power is removed from the Module the key in RAM is destroyed.

### 6.3 Key Zeroization

Each key can be zeroized by using the key zeroization command. This command is allocated to the Crypto-Officer. All persistently-stored keys and CSPs can be zeroized by uninstalling the cryptographic module software and securely overwriting the hard drive. The secure overwrite process is allocated to the Crypto-Officer role and must be performed by or under the direct supervision of the Crypto-Officer.

### 7. Self-Test

The Module performs power-up self-tests as follows when the Module is power up.

- Software/firmware integrity test. This is the Error Detection Code (EDC) peformed on the Module.
- Cryptographic algorithm test. This is the known answer test for Triple DES CFB mode for encryption only.

And the above mentioned power-up tests can perform if authenticated operator requires the tests on demand.

#### 8. Security Policy

The Module provides the following security policy:

- 1) Crypto-Officer is responsible for secure setup and initialization of the Module.
- 2) Only one Crypto-Officer is defined for the Module.
- 3) The Crypto-Officer is the only Role with physical access to the Module.
- 4) When the module has been configured, the Crypto-Officer must remove the keyboard and mouse and install tamper evident seals over the exposed ports (USB, Serial, Stereo Mini Port and DVD drive)
- 5) If tamper seals are removed, keys must be zerozied and the Module must be reinitialized with new keys and any seals that have been destroyed must be replaced. Before any tamper seal can be replaced, the surface must be cleaned and a new tamper seal must be reapplied.
- Password for the Crypto-Officer must be at least 8 alpha/numeric and special characters long. The Crypto-Officer account must locked out after 10 failed login attempts.

#### 9. Operational Environment

The operational environment is non-modifiable.

The Module integrity is protected by disconnecting the ROM reader, keyboard and mouse after the application has been configured and loaded with keys, and also all of the open physical ports and the covers/doors are sealed with tamper evident seals. The hardware platform is also secured in a combination locked cabinet when operational. The operating system also has a firewall installed to prevent remote access to the Module. The module is never connected to the Internet.

#### 10. Mitigation of Other Attacks

The Module will not implement security mechanisms to mitigate the other attacks.

#### **11. Setup and Initialization Procedures**

When the Module has been received from the factory, the following procedures must be performed in order to configure the Module in FIPS Mode of operation:

### Command Encryption Module Security Policy Version 2.0

- 1. The Crypto-Officer must be authenticated to the Module.
- 2. The Crypto-Officer must configure a firewall to permit remote access only for IP address and dedicated TCP ports of the Server and deny any other incoming or outgoing connections. The procedures for configuring the firewall rules can be found in the Command Encryption Module Installation Guidance document.
- 3. The Crypto-Officer must connect the ROM reader to the hardware platform via the USB port.
- 4. The Crypto-Officer must load the triple-DES encryption keys.
- 5. The Crypto-Officer must turn on the key change service.
- 6. The Crypto-Officer must turn on the Encryption Service.
- 7. The Crypto-Officer must disconnect the ROM reader, mouse and keyboard and insert tamper seals over the USB, Serial, Stereo Mini Port and DVD drive ports.
- 8. The User must send the authenticated Key Change command from the Server to initialize the key into memory.
- 9. The User must view that the encryption key has been successfully initialized.
- 10. It is the User's responsibility to verify that the module returns "Encryption key update success" in order to confirm the encryption key change completed successfully.
